## How do Module Interacting Sprites Work?

Module interacting sprites are powered by a combination of HTML, CSS, and JavaScript. HTML provides the structure and content of your design, CSS adds the visual styling, and JavaScript controls the behavior and interactivity. By utilizing these three technologies, you can create sprites that respond to user actions and transform your designs into interactive masterpieces.

The process starts by defining the different modules that make up your design. These modules can be images, text boxes, buttons, or any other element on your page. Each module is assigned a unique identifier, allowing you to target them individually in your JavaScript code.

Next, you specify the desired behavior for each module. This can range from simple animations like fading in and out, to more complex interactions like dragging and dropping. By harnessing the power of JavaScript, you can bring your modules to life with a variety of exciting actions and effects.

To make it even more engaging, you can use long descriptive keywords for the alt attribute of your sprites. This will provide additional context for visually impaired users, allowing them to understand the purpose and functionality of each module interacting sprite.

## The Benefits of Module Interacting Sprites

Module interacting sprites offer numerous benefits for designers and users alike. Firstly, they provide a more engaging and interactive user experience. Instead of

static designs, users can interact with elements on the page, making the overall experience more memorable and enjoyable.

Secondly, module interacting sprites encourage creativity and experimentation. As a designer, you have the freedom to explore new ways of presenting information and delivering your message. By incorporating interactive elements, you can capture the attention of your audience and leave a lasting impression.

Thirdly, module interacting sprites can improve user engagement on your website or app. When users are actively involved in the experience, they are more likely to stay longer, explore further, and take the desired actions. This can lead to higher conversion rates, increased user satisfaction, and overall success for your digital projects.

UCL ScratchMaths is a set of sequenced materials designed to engage 9-11 year old children with mathematical concepts through their exploration using pre-built programs in Scratch. Children not only develop key mathematical skills but also crucial computational concepts.

Module 3 focuses on parallelism and building behaviours for multiple sprites, firstly isolated reactions to an event (when this sprite clicked), using conditions and expressions linked to coordinates, and then implementing interactions between multiple sprites using broadcasting.
